Guide: Asst. Professor Suganthi J

Date: 04-04-2026

ABSTRACT

Banquet hall booking is a structured process used to reserve venues for events such as weddings, corporate meetings, and social gatherings. This project focuses on developing a CRM-based application that simplifies and automates the booking process. The system allows users to check hall availability, enter event details like date, guest count, seating arrangements, catering preferences, and special requirements.

Based on user inputs, the system generates suitable packages, pricing details, and service options. Once the booking is confirmed, the CRM helps manage event planning activities such as menu selection, decoration, and audiovisual setup. It ensures effective communication between clients and event coordinators. Overall, the system reduces manual effort, improves customer experience, and enhances operational efficiency.

INTRODUCTION

Banquet halls are widely used for hosting events, but managing bookings manually can be time-consuming and error-prone. This project introduces a CRM-based solution that digitizes the entire booking and event management process.

The system provides an easy-to-use interface for customers to check availability and book halls, while administrators can manage bookings, clients, and services efficiently. By integrating CRM features, the system improves customer relationship management, enhances service quality, and ensures smooth coordination of events.

---

1. PROBLEM STATEMENT

Traditional banquet hall booking systems rely heavily on manual processes such as phone calls, paper records, or spreadsheets. This leads to:

- Double bookings and scheduling conflicts
- Lack of transparency in pricing and services
- Poor customer communication
- Difficulty in managing event details

Hence, there is a need for a digital system that automates booking, improves accuracy, and enhances customer satisfaction.

2. PROJECT OBJECTIVES

- To develop a user-friendly CRM application for banquet hall booking
- To automate hall availability checking and booking process
- To manage customer data efficiently
- To provide customized packages based on user requirements
- To improve coordination between clients and event planners
- To reduce manual errors and operational delays

3. SYSTEM OVERVIEW

The system consists of two main modules:

1. **Customer Module**
    - View hall availability
    - Book events
    - Select services
2. **Admin Module**
    - Manage bookings
    - Manage customer details
    - Update packages and pricing

The system uses CRM tools to track interactions, manage leads, and ensure customer satisfaction.

4. SYSTEM ARCHITECTURE

The system follows a **three-tier architecture**:

- **Presentation Layer** – User interface (web/mobile)
- **Application Layer** – Business logic (CRM processing)
- **Database Layer** – Stores customer, booking, and service data

Salesforce CRM can be used as the backend platform for managing workflows and automation.

5. FUNCTIONAL REQUIREMENTS

- User registration and login
- Hall availability checkin
- Booking management
- Package selection
- Payment processing (optional)

5.1 Salesforce CRM Implementation

- Use Salesforce objects for customers, bookings, and services
- Create dashboards for monitoring bookings
- Automate workflows using Salesforce tools

5.2 Apex and Triggers

- Validate booking dates
- Prevent double bookings
- Automate confirmation messages

5.3 Batch Jobs

- Process bulk bookings
- Generate reports
- Clean old data

6. DATA MODEL

Entities include:

- Customer
- Booking
- Hall
- Event
- Services

Relationships:

- One customer → multiple bookings
- One booking → one hall
- One event → multiple services

7. SYSTEM DESIGN

7.1 Salesforce Setup

- Create custom objects
- Define fields and relationships
- Set user roles and permissions

7.2 Flow Automation

- Automate booking confirmation
- Send reminders to customers
- Notify admin of new bookings

8. APEX IMPLEMENTATION

Apex is used to:

- Handle backend logic
- Validate booking conditions
- Automate processes

Example:

- Prevent booking if hall is already reserved
- Calculate total cost dynamically

9. CODES OF YOUR PROJECT

```
public class BillingTriggerHandlerClass {

    public static void BillingCreationonBooking(List<Banquet_Hall__c> bHallList) {

        List<Billing__c> billList = new List<Billing__c>();
```

```
        for (Banquet_Hall__c bHall : bHallList) {

            if (bHall != null) {
                Billing__c bil = new Billing__c();

                // Map fields correctly
                bil.Customer_Name__c = bHall.Name;  // or Id if lookup
                bil.Email__c = bHall.Email__c;

                billList.add(bil);
            }
        }

        if (!billList.isEmpty()) {
            insert billList;
        }
    }
}
trigger BillingTrigger on Banquet_Hall__c (after insert) {

    if (Trigger.isAfter && Trigger.isInsert) {
        BillingTriggerHandlerClass.BillingCreationonBooking(Trigger.new);
    }
}
```

10. TESTING

Types of testing performed:

- Unit Testing
- Integration Testing
- System Testing

Ensure:

- No booking conflicts
- Correct price calculation
- Proper user interaction

11. RESULTS

- Reduced booking time
- Improved customer satisfaction
- Accurate scheduling
- Efficient data management

12. ADVANTAGES

- Automation reduces manual work
- Real-time availability checking
- Better customer relationship management
- Improved efficiency and accuracy

13. WHAT WE LEARNED

- CRM concepts and implementation
- Salesforce tools (Apex, Triggers, Flows)
- System design and development
- Team collaboration

14. FUTURE ENHANCEMENTS

- Mobile application support
- Online payment integration
- AI-based recommendations
- Chatbot for customer support

15. CONCLUSION

The CRM-based banquet hall booking system provides a modern solution to traditional booking problems. It enhances efficiency, improves customer experience, and ensures smooth event management. The system demonstrates the importance of CRM in real-world applications.
